Titus Andronicus is in some ways the most brutally and psychotically violent play written by Shakespeare. Although Shakespeare portrays the character of Titus in a somewhat sympathetic light and indicates that the brutality stems from a sick mind, the tragedy ends in death and blood-shedding and implies that certain sins are visited upon the heads of those who commit them. Though not unusual for the time, Shakespeare's Titus is not the work of a naive and inexperienced poet, but a playwright with an unmatched ability to peer into the minds of his characters and express the depth of human emotion. In Titus Andronicus, Shakespeare portrays both lust and revenge in extreme terms, but at the same time he makes clear that even these two most prominent human drives cannot all be achieved without inner turmoil. He did not fail to understand the importance of catharsis: By drawing an honest and all too human picture a1d647c40b

Gastric carcinoma is the fifth most common cancer, and it has one of the lowest rates of curability. The mechanism of the failure to cure is still unknown, and one possible mechanism is the local accumulation of tryptophan. Tryptophan is an essential amino acid for the growth and development of many types of cells; however, it is also a potent immunomodulatory amino acid. Indoleamine 2,3-dioxygenase (IDO) is an enzyme that degrades tryptophan via the kynurenine pathway. We investigated the possible relationship between IDO expression and gastric carcinoma. Immunohistochemical staining was performed on 100 gastric carcinomas to determine IDO expression, and the results were compared with clinicopathological findings and treatment results. The IDO expression was more frequent in the non-differentiated type of gastric carcinoma (45%) than in the differentiated type (14%). IDO expression was significantly higher in patients treated with neither surgery nor chemotherapy. IDO expression is related to the differentiation of gastric carcinoma, and the expression of IDO is associated with gastric carcinoma that is not responsive to chemotherapy or irradiation. Therefore, the IDO expression might be a new target for the treatment of gastric carcinoma.Q: Socket.io how to connect to multiple server I have an app that should connect to 2 different servers.
