Enroll today for your first or upcoming class with one of the most advanced, comprehensive science and math learning resources on the market. Our massive library of lessons and activities will help you master math and science fundamentals, and prepare you for success in every area of your high school curriculum. With more than 3,000 lessons, it's like having an entire school of high school teachers online just waiting to help you learn. As students begin to look at higher levels of mathematics, they usually find that they enjoy the subject more than when they were at an elementary level. When you are dealing with difficult numbers, or when you are trying to solve advanced equations, you need the help of a more organized, logical approach. Here are a few of the many topics that a 2nd grade math student could use to improve their skills: Number Sense From multi-digit number relationships to counting with numbers, students must have a good understanding of these skills. If students are not able to tell the difference between the digits 2 and 4, then they have not fully mastered this concept. You can help students by teaching them to think about the numbers in your daily life and show them that there is a relationship between the numbers. You may want to spend some time pointing out the relationships that many of us take for granted. For example, you may want to help them understand that 4 is two times 2. Distributive Properties

As students advance to the 3rd and 4th grade, they need to understand the distributive property. This helps students solve problems involving multiple problems with equations. In other words, they are better able to solve problems involving multiplication. You will want to spend time with students showing them that when they multiply a number and a positive quantity, the result is positive. This is very important when students are solving problems in higher grade levels. Fractions Fractions are one of the most difficult concepts to master, and you will want to help students understand the concept as they advance to the 3rd grade. They must learn to break down numbers in half. They must know how to convert fractions into decimals and vice versa. You will want to find a way to help them understand that a fraction is the same thing as the quotient of two whole numbers. Measurement In the 3rd grade, students begin to learn about measurement. As they understand units, they are able to measure objects and problems. They must be able to show how

Build a Molecule is a Java-based application that can help you learn more about how molecules are formed. You can complete a number of assignments and view the created molecules in 3D. Build molecules and visualize them At first, you will be provided with a few hydrogen and oxygen atoms which you can combine to create molecules. More chemical elements will become available later on, and you can merge them in numerous ways. Once you've created a molecule, you can add it to your collections and open a 3D representation. There are multiple tasks that need to be completed, which teachers can assign to students. Collect multiple types of molecules After completing the initial tasks, you can move to the second tab and try to collect a certain number of molecules, as is indicated in the right-side panel. You have a limited number of atoms to work with, and you have to figure out how to combine them. If you get something wrong, you can always separate them atoms and refill the kit. There are multiple kits available, and you can switch between them at any time. Build complex molecules Lastly, the application provides you with a large number of atoms that you can combine as you see fit. There are no goals to accomplish, but you can build complex molecules and visualize them in 3D. All in all, Build a Molecule is a very useful piece of software for teachers and users looking to learn more about chemistry. It is easy to use, and it lets you view the molecules you have created in a 3D representation. MIT Grand Challenge Teachers Find More Ways to Engage Students in Design Thinking Design thinking can be a powerful way to engage students in problem solving and get them excited about learning. But even if you are not new to using design thinking with your students, you may not be sure what kind of design thinking your current project needs. A good way to determine this is to ask students what they think about the project, what the project objectives are, and what the project is trying to achieve. If they are enthusiastic, your project is likely to benefit from the adoption of design thinking. Here are some signs that indicate that you need to add design thinking to your classroom: You are looking for more unconventional approaches to your teaching. You can't find any extra time for your students to use traditional projects, including worksheets and papers. You are looking for more hands-on projects that require students to explore,

Description: Use a 3D virtual representation of atoms and molecules to learn more about the basic building blocks of matter. You will learn all about the six elements, which are hydrogen, carbon, nitrogen, oxygen, calcium, and phosphorus. After that, you will learn how these elements can be combined into numerous molecules and polymers that are commonly used in science, technology, and everyday life. Find out more about the basic building blocks of matter First, you will learn about the basic building blocks of matter. This is something that anyone looking for a biology course needs to know. The first part of the program is the Elements of Chemistry. You will learn all about the six elements, which are hydrogen, carbon, nitrogen, oxygen, calcium, and phosphorus. There are many kinds of atoms and molecules, but they are all connected in a very specific way. Once you understand the basics, you will learn more about the possible combinations of these elements. You will learn how hydrogen, carbon, nitrogen, oxygen, calcium, and phosphorus can be combined together to form a number of molecules and polymers. When you look at a substance, such as water, you see molecules and polymers
